June 2010

Datatex has entered 2010 stronger than ever, the new product suite NOW is already maturing and our development and support structures have been strengthened with improved staffing and tools.

Our claims of open systems were put to test while implementing NOW on Oracle database, tested a fully operational system running under SAP Netweaver and have totally brought our NOW user interface to world leading web standards.

2010 has started with a remarkable increased interest from companies world wide, reaching Datatex thru the web, thru our existing installed base which continues to be by far the largest in the world, and of course thru our global sales and implementation partners.

During the first months of the year Datatex has succeeded in closing new projects, some very large, in Italy, India, China, North America and have many additional pending closures.

Our advanced planning and shop floor systems have also proven of great help to customers to achieve a positive ROI on IT investments. Planning, scheduling and shop floor controls have proven to be another winner application allowing customers to streamline operations under the new difficult market conditions, minimizing inventories and Work In Progress while maximizing quality, customer service and most of all ON TIME delivery.

Datatex customers can now successfully face the changing economy where lead time and prices have reached new lows while financing and cost of raw materials at time are reaching new highs.

In this newsletter, and the following to come this year, you will read about some of Datatex new developments, our newest technology achievements and some of the customer success stories.

We will welcome as usual, any customer based success story or case study to be published in coming releases of the newsletter.

NOW HOT TOPIC OF THE MONTH: Units of measure

Textile is unique, products can be purchased in Kg, produced in picks per minute, processed by meters and sold by square yards. Except the universal yard to Meter ratio all other ratios are product specific in this example. NOW allows the definition of unlimited UM and rations per product. In addition a roll in stock of the same product will certainly have a different length and a different weight to length ratio then the next roll of the same product. NOW has a unique feature where stock of the same item can be perpetually managed by 3 different distinct Units of measure, for example number of rolls, Pounds for weight and Yards for length.
